

11kV 800 AMP 8 Bolt KA Style Coupler

118BKA - Range

Pioneering the Difference.

The AusProof high voltage coupler and adaptor system demonstrates state of the art technology with an innovative design which becomes homogeneous with the cable when terminated. The design offers a continued earth shield, segregating the three phases and maintains the same Symmetrical radial distribution of voltage stress, as in the cable design. This eliminates the risk of a phase to phase fault.

The face profile and silicon rubber connector expels all air when connected, eliminating condensation, dust and corona. The type tests performed were all based on high voltage, cable specification requirements, and the results prove; that the coupler is as good as the cable.

Electrical Type Test Results

11kV 800A Coupler

Through Fault Current

20kA for 0.3 seconds
20kA for 0.3 seconds
20kA for 1.0 seconds
At 10 minute intervals

Impulse Voltage

95 kV 10 pos and 10 neg
110kV 10 pos and 10 neg

A/C High Voltage Withstand

24kV for 1 minute
50kV for 1 minute
35kV for 6 hours

Partial Discharge

Prior to 6 hour
High voltage withstand 10pC
After 6 hour
High voltage withstand 0.6pC

22kV 425A Coupler

Through Fault Current

20kA for 0.3 seconds
20kA for 0.3 seconds
20kA for 1.0 seconds
at 10 minute intervals

Impulse Voltage

125 kV 10 pos and 10 neg

A/C High Voltage Withstand

50kV for 1 minute

High Voltage Cable Coupler System

Technical Guide

Stock No: (see page 4 breakdown)
Description: Half Coupler for Trailing Cable
Rating: 11kV 800A
Material: Aluminium
LOA: 665mm
Mass: 16kg
Volume: 4 litres

Stock No: (see page 4 breakdown)
Description: Half Coupler for Armoured Cable
Rating: 11kV 800A
Material: Aluminium
LOA: 665mm
Mass: 16kg
Volume: 4 litres

Stock No: (see page 4 breakdown)
Description: KA Adaptor
Rating: 11kV Adaptor
Material: Aluminium
LOA: 480mm
Mass: 16kg
Volume: 4 litres

Stock No: RS1775
Description: Insulated End Cover
Rating: 11kV
Material: Aluminium
Mass: 5kg

Stock No: RS112 (3 required per joint)
Description: Phase Connectors
Rating: 11kV 800A

Stock No: 2511
Description: Cast Protection Cover
Rating: 11kV
Material: Aluminium
Mass: 3kg

Stock No: RS113
Description: Earth Pilot Connector
Rating: 11kV 800A

KA 11kV 800A Unarmoured

Termination Procedure

KA 11kV 800A Gear Mount Adaptor

Termination Procedure

KA 11kV 800A Armoured

Termination Procedure

Contact Pulling Tool Operation

Observation

Inspect the front end of the coupler or adaptor, paying special note to the condition of the circlip on each phase. Each circlip should be sitting evenly on the contact. If more of the circlip protrudes out of one side, then the circlip needs to be replaced.

If the circlip needs to be adjusted or replaced, the following will need to be performed

- Ensure power is not connected.
- For a coupler, loosen the clamp on the gland to slightly release the grip on the cable.
- Clean out threaded hole in end of contact with air or cloth
- Place a new circlip over the end of the contact.
- Screw the bolt of the assembled pulling tool into the end of the contact
- Push the steel plate up against the face of the coupler.
- Tighten the nut and washer up to the steel plate.
- Using a spanner, tighten the nut against the steel plate to pull the contact back into place.
- Whilst in this position, replace the circlip.
- After all three contacts are satisfactory, retighten the gland.

Inserting Connectors and Coupling Operation

Offsite Checks & Testing Procedures

For 11kV Aluminium Coupler System

To compliment existing procedures and practices currently existing in cable repair workshop, the following is designed to be completed as a minimum to ensure the safe and long operation of the AusProof coupler system

Routine Checks and Inspection

- When cables are not in use or stored, ensure that a cast protection end cover is fitted that provides adequate sealing against moisture.
- Ensure that witness marks are brightly painted on the sheath, located where the cable enters the gland. This needs to be routinely inspected to check if a gap appears between the end of the gland and the witness mark.
 - A gap may indicate that the cable has been under tension and that the termination in the coupler may have moved.
- Inspect the male pin in the coupler for obvious signs of damage. Also inspect the location of the nylon locking circlip to ensure that it is evenly fitted onto the contact.
 - If the circlip appears dislocated or damaged then repairs are necessary. This event indicates that the termination in the coupler has been under tension as a result of handling.
- Ensure the tension on the gland housing compression ring is maintained. This process requires that the four compression ring bolts are tensioned.
- Check silicon seals are clean and are fully intact.
- Thoroughly clean the insulators and face of the coupler with suitably approved solvent.

Testing Precautions

- During cable testing and fault location, high voltage withstand and impulse technologies are used. When the voltage is applied to a cable with couplers fitted then both ends of the phases being tested needs to be connected to the source.

For high voltages this is necessary to prevent an uncontrolled escalation of voltage at the end of the conductor being tested.
